

PHASEBOOK

Quarterly Newsletter: Spring 2024

Breakthrough anti-microbiota vaccine could become the first commercial example of a vaccine against a target's microbiome.

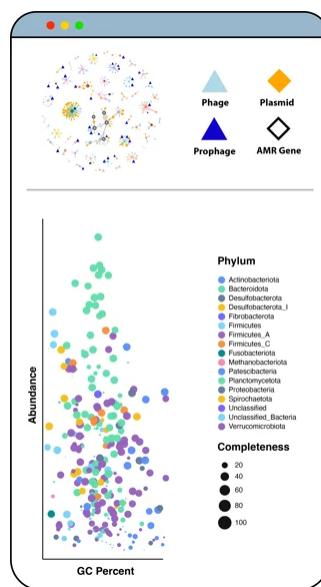

Phase Genomics' technology helps crack the code on a potential new vaccine for farmed salmon to defend against sea lice by targeting the parasite's microbiome. Published in [The Economist](#), researcher Cristian Gallardo Escárate shares results that led to the creation of the groundbreaking invention that could ease global environmental impacts of salmon farming.

ProxiMeta™ Explorer

This summer, we launched a new interactive, cloud-based genome-resolved metagenomic analysis platform, for data visualization and exploration. Dive deep on

a single sample with powerful taxonomic annotation and abundance calculations, or zoom out to a large dataset comprising dozens or even hundreds of samples. Fully customizable analyses and reports allow you to track genomes across time, conditions, groups, and more with a click of a button.

An Upgraded Approach to Cytogenetic Research

Understanding chromosomal aberrations is crucial for assessing patient care in oncology. [Genomic Proximity Mapping™ \(GPM\)](#) streamlines cytogenetic analysis—not only meeting, but surpassing current risk stratification assessments. Last month, researchers at Fred Hutchinson Cancer Center and University of Washington Medical Center published research that used GPM to analyze 48 patient samples, identifying known and novel chromosomal aberrations. Read the MedRxiv preprint to discover the expanding possibilities in leukemia research [here »](#)
